

AI Revenue Recovery — Video Script

Target: 5:00 · Razorpay AI Buildathon submission

0:00–0:20

Hook

<i>Landing page hero</i>	"Every payment gateway in India drops some transactions — timeout, low balance, someone bails mid-OTP. Most businesses just eat that loss. This one doesn't."
<i>Scroll to stat strip</i>	"This is my build for Razorpay's AI Revenue Recovery track. One rule drives the whole thing: the AI never decides what happens to a customer's payment. A fixed table decides. The AI just writes the message."

0:20–1:00

How it works

<i>"How it works" cards</i>	"Quick version — Razorpay tells us why it failed. A fixed table, not a prompt, picks what to do: retry, switch to UPI, send a reminder, or escalate. Gemini writes the actual message, in Hinglish, naming the real reason it failed. And it's capped at three tries. Hard stop, in the code."
<i>Decision table</i>	"This table is the entire brain of it. The LLM never touches it. Attempt four literally can't happen — the code throws an error before it gets there."

1:00–2:30**Live demo**

<i>Open Dashboard</i>	"Let me just show you this live."
<i>Outcomes panel</i>	"92 real transactions, 62% recovered, pulled straight from the database right now."
<i>Live Demo, pick Bank Timeout</i>	"Watch — I'm about to fire a real failed payment at my own backend."
<i>Click Trigger, wait</i>	"There it is. Classified it, picked the strategy from the table, worked out a smart retry delay, made a real payment link, and Gemini just wrote this."
<i>Read the message aloud</i>	"[read it] — that's not a template. It just wrote that."
<i>Type a vague note</i>	"Now let's try to break it. I'll give it a genuinely useless note."
<i>Submit, point at confidence badge</i>	"Low confidence. So instead of guessing, it stops — sends it to a human instead of nudging someone based on a guess."

2:30–2:55**Story mode + Refresh**

<i>Click Story mode</i>	"There's a guided tour built in too."
<i>A couple steps</i>	"Just walks through the real panels, live."
<i>Exit, click Refresh</i>	"And Refresh actually fires new real transactions — watch the numbers move."

2:55–3:35**Proof**

<i>System Guarantees</i>	"None of this is just a claim — it's all checkable. Zero decisions made by the LLM, pulled live from the audit log."
<i>Mention webhook</i>	"There's also a real signed Razorpay webhook behind this. Didn't demo it live — needs a public tunnel, too risky during judging — but it's fully tested."
<i>Revenue Impact</i>	"And in money — five lakh recovered out of seven that failed. Without this, that's just zero."

3:35–4:00

It's deployed

Mention deployment

"This is live on the actual internet right now, not localhost. Found and fixed a real bug in my own rate limiter while deploying it."

4:00–4:35

The honest part

README / camera

"I'm not pretending this is perfect. Some payment links are mocked — Razorpay caps test links at 30, that's disclosed. Recovery numbers come from a simulated model, also disclosed. Everything else is real."

4:35–5:00

Close

Wide shot

"It's live at this link — go try to break it yourself. It's a real system with an actual safety net, and the AI stays exactly where it belongs. Thanks for watching."

If running long, cut in this order: the webhook mention → tighten "how it works" to one sentence → shorten Story Mode/Refresh to just one line each. **Never cut:** the live demo or the honest part — those are what actually differentiate this.
